

Using GCC/GDB With CC2538

Bjorn Selvig

1

ABSTRACT

This document describes how to set up an open source software-based development environment for the Texas Instruments CC2538 using Eclipse as IDE.

Project collateral and source code discussed in this application report can be downloaded from the following URL: http://www.ti.com/lit/zip/swra443.

SmartRF, Code Composer Studio are trademarks of Texas Instruments.

Linux Mint is a trademark of Linux Mark Institute.

Linux is a registered trademark of Linux Torvalds in the U.S. and other countries.

Windows is a registered trademark of Microsoft Corporation in the United States and/or other countries, or both.

All other trademarks are the property of their respective owners.

Introduction www.ti.com

1 Introduction

The CC2538 is a low-power radio device with an integrated ARM Cortex-M3 MCU. For more information about CC2538, see [1] and [2].

This document describes which software packages are necessary, and provides installation and configuration instructions for each. It also describes how to use this tool chain setup to debug a software example for the CC2538.

Section 2 and Section 3 list the software packages and hardware required for this tool chain setup.

Installation procedures for the software packages are provided in Section 4.

Section 5 describes how to use the tool chain setup to build, program, and debug a software example for CC2538.

This setup has been tested on a Windows® 7 and on a Linux Mint™ machine.

CDT C/C++ Development Tooling DK Development Kit EΒ **Evaluation Board** ΕM **Evaluation Module** GCC The GNU Compiler Collection **GDB** The GNU Project Debugger IDE Integrated Development Environment JRE Java Runtime Environment

Table 1. Acronyms

2 Prerequisites

2.1 Platforms

This tools setup has been tested on Windows 7 and on Linux Mint 12. Most of the setup instructions will be identical for these platforms. In those cases where the instructions differ on Linux®, this is noted in the text.

2.2 Hardware

The following hardware pieces are required:

- SmartRF06EB
- CC2538EM
- USB cable

These two boards are part of the CC2538DK. The SmartRF06EB has an integrated XDS100v3 emulator. For more information about the hardware, see [3] and [4].

www.ti.com Prerequisites

2.3 Software

This section describes the software packages that are required with this application report. Tools components, other than the packages below, might be used as well, for example, newer versions of the tools that have become available after this document was written. The following packages and versions were tested together during the writing of this document.

- An IDE. For example Eclipse and the following belonging components:
 - Java Runtime Environment JRE:
 - http://java.com/en/download/index.jsp
 - Eclipse Luna 4.4.1
 - http://archive.eclipse.org/eclipse/downloads/drops4/R-4.4.1-201409250400/
 - CDT (C/C++ Development Tooling) version 8.5.0 for Eclipse Luna http://www.eclipse.org/cdt/downloads.php
- A GCC Compiler. For example:
 - GNU Tools for ARM Embedded Processors 4.8 https://launchpad.net/gcc-arm-embedded
- Build tools for Windows. For example:
 - MinGW
 - http://www.mingw.org/
- A GDB agent and a Flash programmer tool. For example:
 - For Windows: XDS100v3 EMUpack + GDB agent
 http://processors.wiki.ti.com/index.php/XDS Emulation Software Package
 - For Windows: SmartRF™ Flash Programmer 2
 http://www.ti.com/tool/flash-programmer
 - For Linux: Code Composer Studio™ Uniflash Standalone Flash Tool http://www.ti.com/tool/uniflash
- Blink LED software example for GCC (packaged with this document)

Download and installation instructions for each software package are provided in Section 4.

3 Hardware Setup

For instructions on how to configure the hardware, see [4].

4 Software Installation Instructions

4.1 Eclipse IDE (Windows)

Follow these instructions to install Eclipse and CDT on a Windows platform. Note that the Eclipse IDE is dependent on Java Runtime Environment being installed on the machine. Make sure JRE is installed, and that the installation path is added to your environment variables, before the installation of Eclipse. Note that both JRE and Eclipse must be downloaded for the same platform (the 64-bit version of Eclipse requires the 64-bit version of JRE).

- 1. Download Eclipse from the following location: http://eclipse.org/downloads/index.php.
- 2. Unzip the downloaded package.

- 3. The Eclipse IDE can now be started by running the eclipse.exe file. Eclipse will ask for a folder to use for workspace location when it is started. If Eclipse reports that it cannot find the Java Runtime Environment, make sure that the installation path is added to your environment variables. This is done by going to Control Panel → System and Security → System → Advanced system settings. Append the path of the bin folder in the JRE installation to the PATH variable.
- 4. Verify the installed versions of the package under Help → About Eclipse SDK.

The following instructions describe how to install the CDT plugins:

- 1. Download the CDT for your version of Eclipse from: http://www.eclipse.org/cdt/downloads.php.
- 2. Start the Eclipse IDE. If on Windows 7, make sure that Eclipse is run as administrator to allow for the new installations. If the Welcome screen is shown, click on the Workbench icon to open the workbench. Then, click Window → Open Perspective → Other... and select the C/C++ perspective. Navigate to Help → Install New Software (see Figure 1).

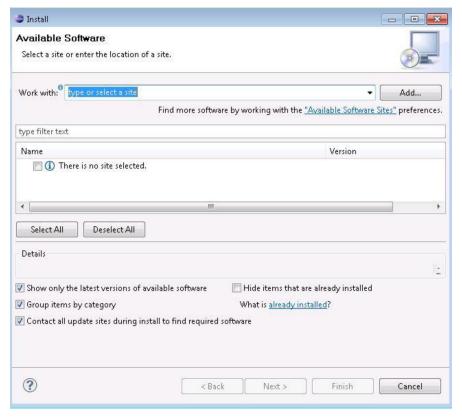

Figure 1. Eclipse IDE (Windows)

3. Press the 'Add..' button and the Add Repository popup window is shown. Fill in 'CDT' as the name. Press the 'Archive' button and browse to the downloaded CDT *.zip file. Press OK.

4. Select both 'CDT Main Features' and 'CDT Optional Features' to install (see Figure 2).

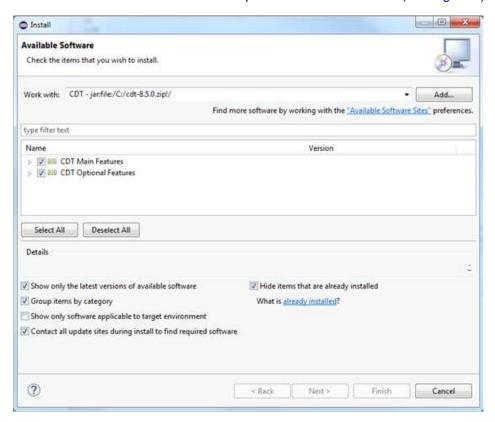

Figure 2. Installing CDT

- 5. Click 'Next' twice and accept the licence agreements. Click 'Finish' to install the CDT package.
- 6. When finished, click Yes to restart Eclipse.

Verify that the CDT components are correctly installed. Navigate to Help → About Eclipse SDK and click 'Installation Details'. Make sure that the C/C++ Development Platform and the C/C++ GDB Hardware Debugging are both installed (see Figure 3).

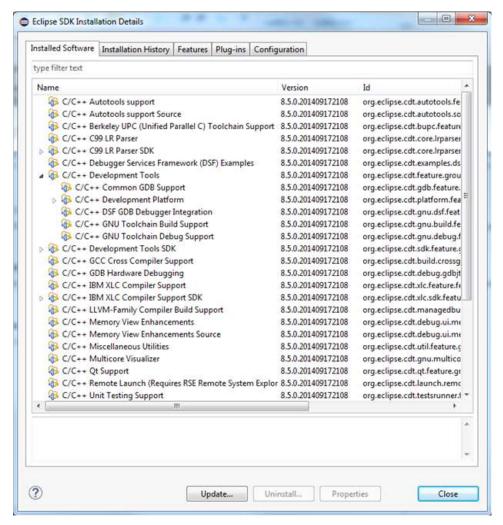

Figure 3. Installation Details

4.2 Eclipse IDE (Linux)

Follow these instructions to install Eclipse and CDT on a Linux platform. Note that the Eclipse IDE is dependent on Java Runtime Environment being installed on the machine. Make sure JRE is installed before installation of Eclipse IDE.

- Download Eclipse from the following location: http://eclipse.org/downloads/index.php. Choose the installer for your Linux platform.
- 2. Extract the downloaded package.
- 3. The Eclipse IDE can now be started by running the binary file eclipse. Eclipse will ask for a folder to use for workspace location when it is started. If Eclipse reports that it cannot find the Java Runtime Environment, open the eclipse.ini file and add the following command direct under the 'openFile' statement:

4. Verify the installed versions of the package under Help → About Eclipse SDK.

The following instructions describe how to install the CDT plugins:

- 1. Download the CDT for your version of Eclipse from: http://www.eclipse.org/cdt/downloads.php.
- 2. Start the Eclipse IDE. Make sure that Eclipse is run with administrator privileges to allow for the new installations (see Figure 4). If the Welcome screen is shown, click on the Workbench icon to open the workbench. Then, click Window → Open Perspective → Other... and select the C/C++ perspective. Navigate to Help → Install New Software.

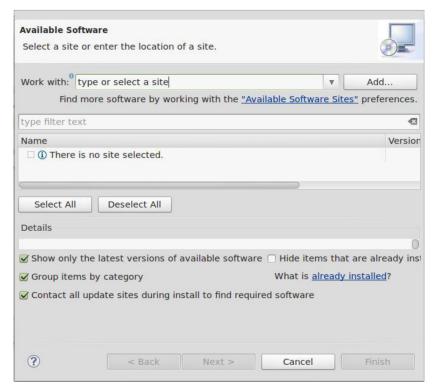

Figure 4. Eclipse IDE (Linux)

3. Select Add → Archive... and browse to your downloaded archive file. Name it CDT and click OK (see Figure 5).

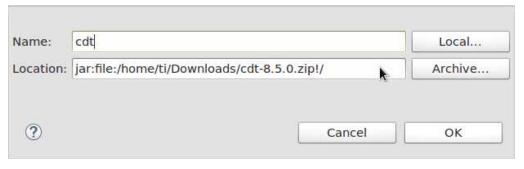

Figure 5. Installing CDT (Linux)

4. Follow step 4 in Section 4.1. These final steps for Windows and Linux are equal.

4.3 GNU Toolchain (Windows)

GNU Tools for ARM Embedded Processors is a free package that includes the GNU compiler and linker tools as well as the GNU debugger. Perform the following steps for Windows installation:

- Download GNU Tools for ARM Embedded Processors. The package can be found on this site: https://launchpad.net/gcc-arm-embedded.
- 2. Run the installer and follow the instructions. In the last step, make sure to select the checkbox 'Add path to environment variable'.
- 3. Verify from the command prompt that the package is installed is updated correctly.

This can be done by clicking Start \to Run... . Type in cmd and click OK. In the command window, write:

```
arm-none-eabi-gcc --version
```

The expected output is shown in Figure 6. If the arm-none-eabi-gcc program is not found, check that the PATH variable is correctly set.

```
C:\Windows\system32\arm-none-eabi-gcc --version
arm-none-eabi-gcc (GNU Tools for ARM Embedded Processors) 4.8.4 20140725 (releas
e) [ARM/embedded-4_8-branch revision 213147]
Copyright (C) 2013 Free Software Foundation, Inc.
This is free software; see the source for copying conditions. There is NO
warranty; not even for MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.
```

Figure 6. GNU Toolchain (Windows)

More information about this package can be found in [5].

4.4 GNU Toolchain (Linux)

Perform the following steps for the Linux installation of GNU Tools for ARM Embedded Processors:

- 1. Download GNU Tools for ARM Embedded Processors. The package can be found on this site: https://launchpad.net/gcc-arm-embedded.
- 2. Unpack the tarball to the install directory with the following command:

```
$ cd <install_dir> && tar xjf gcc-arm-none-eabi-*-yyyymmdd-
linux tar bg?
```

Add the installation path to the PATH variable with the following command:

```
$ export PATH=$PATH:<install_dir>/gcc-arm-none-eabi-*/bin
```

4. Check that the correct version is installed with the command:

```
$ arm-none-eabi-gcc -v
```

More information about this package can be found in [5].

4.5 Build Tools for Windows

If your development platform is Windows, an additional command line program, 'make', is required by the Eclipse external builder. One choice is to download the MinGW tool. Perform the following steps for installation:

- Download the MinGW setup tool from http://www.mingw.org/.
- 2. Run the Setup. Choose default installation directory. Click Continue when the setup is finished, to open the installation manager.
- 3. In the Installation Manager, select 'all Packages'. Choose the packages mingw32-make and mingw32-gcc by clicking on the names and selecting 'mark for installation'. Then, select Installation → Apply Changes and click the 'Apply' button (see Figure 7).

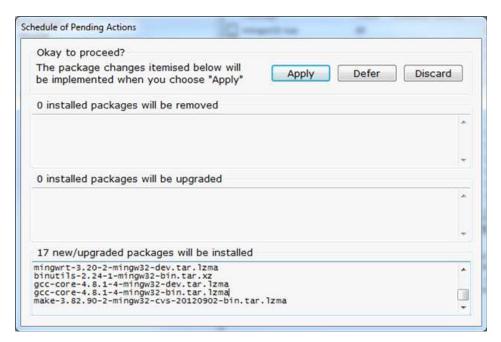

Figure 7. Schedule of Pending Actions

4. Add the installation path (default: C:\MinGW\bin) to your environment variables.

4.6 TI Emupack and GDB Server (Windows)

The following two steps are necessary only for Windows:

- Download the XDS Emulation Software Package from the following location: http://processors.wiki.ti.com/index.php/XDS_Emulation_Software_Package.

 This includes drivers for the XDS emulators and the GDB server.
- 2. Run the installer. Select the typical installation and default installation directory.

4.7 Flash Programmer (Windows)

The following two steps describe the installation of the Flash programmer tool for Windows:

- 1. Download SmartRF Flash Programmer 2 from the following location: http://www.ti.com/tool/flashprogrammer.
- 2. Unzip the downloaded file and run the installer.

4.8 Flash Programmer (Linux)

The following three steps describe the installation of flash programmer tool for Linux:

- 1. Download CCS Uniflash Flash programmer for Linux from the following location: http://www.ti.com/tool/uniflash.
 - CCS Uniflash includes the TI Emupack and GDB Server.
- 2. Run the installer (uniflash_setup_x.x.x.xxxxx.bin). Select custom installation and make sure that support for Wireless Connectivity devices is installed (see Figure 8).

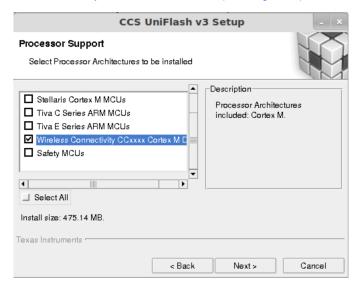

Figure 8. Support for Wireless Connectivity Devices

- Make sure TI emulators, XDS100 class and Spectrum Digital emulator support is installed (see Figure 9).
- 4. If the installed version of TI EmuPack is older than ti_emupack_5.1.402.0, open UniFlash, click Help → Check for Updates, and install the latest version. In the older version, there was a problem using the GDB agent on Linux.

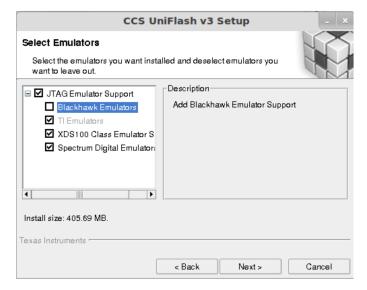

Figure 9. Spectrum Digital Emulator Support

5 Software Example and Eclipse Configuration

This section describes how to open the example project in Eclipse and configure the installed tool chain.

5.1 Import Example Project Into Eclipse IDE Workspace

- 1. Open the Eclipse IDE.
- 2. Navigate to File → Import...
- 3. Select 'General' and 'Existing Projects into Workspace.'
- 4. Click Next.
- 5. Browse to the directory where the example project was downloaded and click 'Finish'.

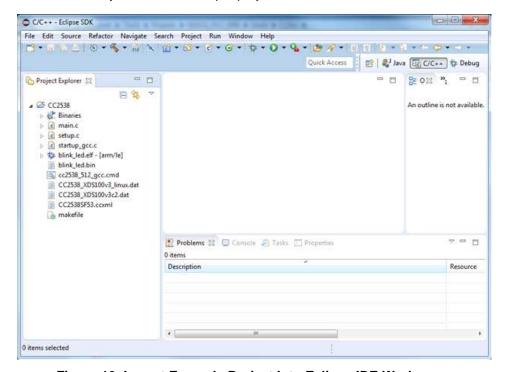

Figure 10. Import Example Project Into Eclipse IDE Workspace

5.2 Configure Eclipse Debugger

This section describes how to configure the Eclipse debugger.

- Right click on the Project and select Debug As → Debug Configurations. The Debug Configurations window will now be shown.
- 2. Right click GDB Hardware Debugging and select 'New'.
- 3. Make sure that the settings in the Main tab are configured as in Figure 11.

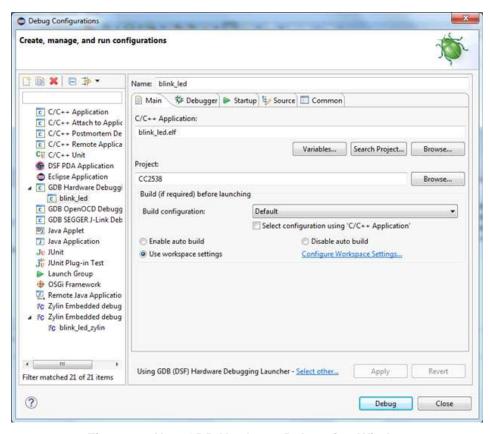

Figure 11. New GDB Hardware Debugging Window

- 4. Select the 'Debugger' tab. Make sure the "Use remote target" box is unchecked. In the GDB command field type in:
 - (a) Windows: arm-none-eabi-gdb.exe
 - (b) Linux: arm-none-eabi-gdb
- 5. At the bottom of the window where the following text is shown' Using GDB (DSF) Hardware Debugging Launcher', press 'Select other'. Mark the checkbox 'Use configuration specific settings' and select Legacy GDB Hardware Debugging Launcher'.

Select the 'Debugger' tab again. The settings should now be as seen in Figure 12.

NOTE: For Linux: In some cases an absolute path to gdb must be used for Eclipse to be able to find it. Use the full path to arm-none-eabi-gdb. This program is found in the bin folder where CodeSourcery is installed.

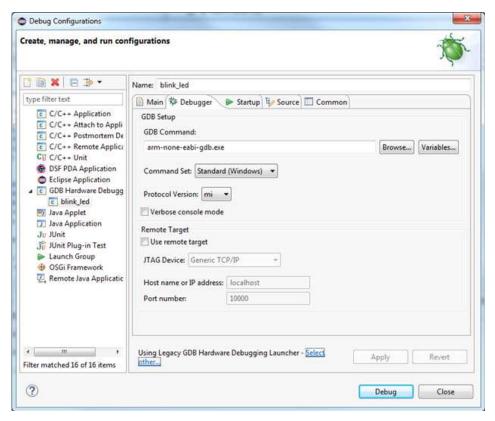

Figure 12. Using Legacy GDB Hardware Debugger Launcher

13

7. Select the 'Startup' tab and configure the same setting as shown in Figure 13. Make sure that 'Load image' is unchecked, and that the same commands in the 'Initialization Commands' window are added. Then click 'Apply' and close the Debug Configurations window.

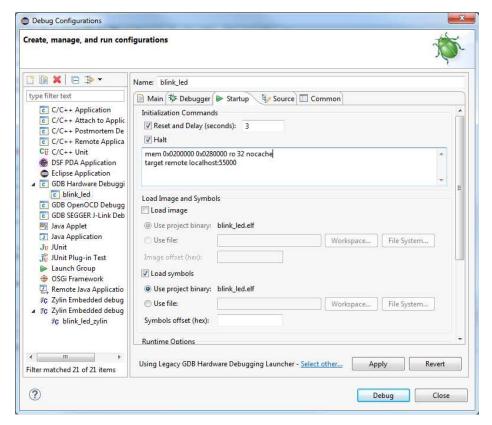

Figure 13. Settings for Startup Tab

5.3 Configure Flash Programmer Tool (Windows)

This section describes how to configure the SmartRF Flash Programmer tool for the Eclipse environment on Windows. The Flash programmer tool is used to load a generated binary image to the target before debugging.

- 1. Start SmartRF Flash Programmer 2 GUI application (installation is described in Section 4.7).
- 2. Start the command line by clicking the tools symbol in the top right corner of the GUI
- 3. Make sure the hardware is connected on the USB and type 'srfprog –ls all' in the command line to detect the connected hardware. If there is one SmartRF EB board connected on USB, the output will be similar to the output shown in Figure 14.

```
Connected devices:

------

O Device: Texas Instruments XDS100v3 A, ID:XDS-06EB121004B7A,

Chip: Unknown

1 Device: USB Serial Port (COM18), ID:COM18,

Chip: Unknown
```

Figure 14. Connected Devices

- 4. Note down the ID of the detected EB board (in the above example it is XDS-06EB121004B7A).
- In Eclipse, open the External Tools Configurations panel: Run → External Tools → External Tools
 Configurations.
- 6. Select 'Program' in the left side panel and press the new button to create a new Tools configuration under 'Program'.
- 7. Fill in the fields 'Name', 'Location' and 'Arguments' as shown in Figure 15. 'Location' should be set to the directory where the SmartRF Flash programmer was installed. The location below is correct when the default installation directory is used.
- 8. Under 'Arguments' make sure to use the same XDS ID number as noted in step 4 (replace XDS-06EB121004B7A as shown in Figure 15 with the ID number noted).
- 9. Note that the serial number (starting with 'XDS') is unique for each SmartRF06EB board. The steps from 3 8 must be repeated if the board is changed.

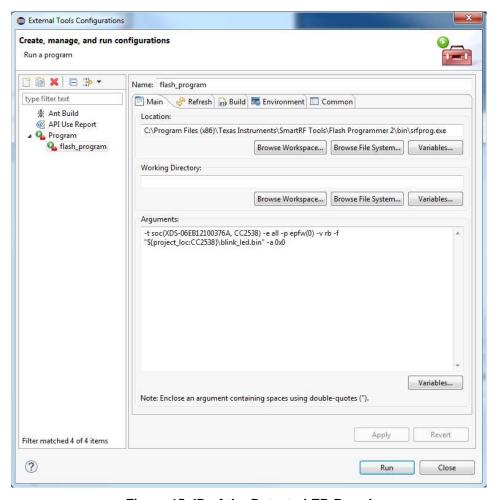

Figure 15. ID of the Detected EB Board

10. Press Apply.

5.4 Configure Flash Programmer Tool (Linux)

This section describes how to configure the CCS Uniflash Flash programmer tool in the Eclipse environment for Linux.

- 1. Open the External Tools Configurations panel; Run → External Tools → External Tools Configurations.
- 2. Select 'Program' in the left side panel and press the new button to create a new Tools configuration under 'Program'.
- 3. Fill in name, location and arguments as shown in Figure 16.

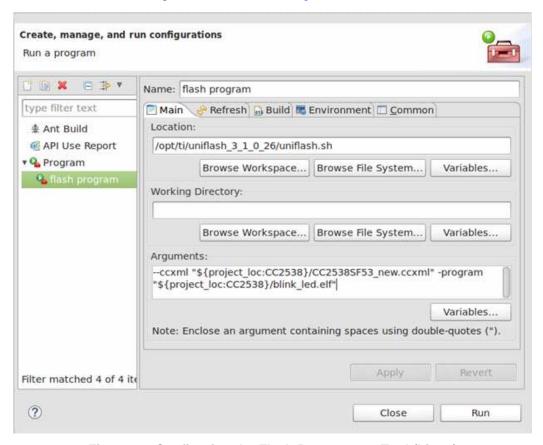

Figure 16. Configuring the Flash Programmer Tool (Linux)

5.5 Launch the GDB Server (Windows)

Perform the following steps to launch and configure the GDB Server for the XDS100v3 emulator on Windows:

- The GDB Server agent is found in the folder where emupack is installed. If emupack is installed in the default directory, it can be found in the folder 'C:\ti\ccs_base\common\uscif'. Launch the GDB Server agent: 'gdb_agent_gui.exe'.
- 2. Press the 'Configure' button and select the board configuration *.dat file for your target. The *dat file for this target is found together with the CC2538 software example. For Windows, use the file 'CC2538_XDS100v3c2.dat'.
- 3. Press the 'Start' button (see Figure 17). The GDB server agent is now started.

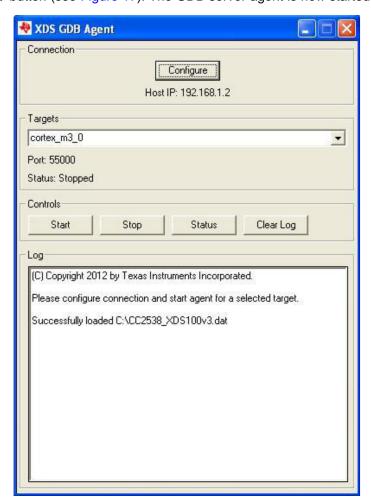

Figure 17. Launching the GDB Server (Windows)

5.6 Launch the GDB Server (Linux)

Perform the following steps to launch and configure the GDB Server for the XDS100v3 emulator on Linux:

1. The GDB server agent is found in the following folder where Uniflash was installed: 'ccs_base\common\uscif'. Launch the GDB Server agent with the following command:

```
gdb_agent_console <board-data-file>
```

The board-data-file is the *.dat file found in the software example package: CC2538_XDS100v3c2_linux.dat.

2. If launched successfully, the output shown in Figure 18 can be seen in the console.

```
Successfully loaded CC2538_XDS100v3.dat
CPU Name Port
-----
cortex_m3_0 :55000

Starting all cores
CPU Name Status
-----
cortex_m3_0 :Waiting for client
```

Figure 18. Launch the GDB Server (Linux)

5.7 Build the Software Example

- Open the Eclipse IDE and select the imported software example. On Windows, specify the make tool
 you are using. Navigate to Project → Properties → C/C++ build. Under the tab 'Builder Settings',
 uncheck 'Use default build command' and type in the build command you are using. If you are using
 the MinGW tools, the command will be mingw32-make.
- 2. Right click on the project name in the Project Explorer window, and select 'Clean Project' to clean the project.

On Windows, the console output from the clean command should be as shown in Figure 19.

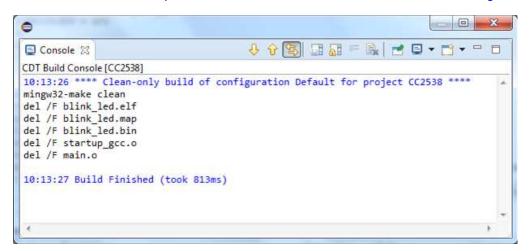

Figure 19. Clean Project

3. Right click the project again and select 'Build Project'. This will create the binary files blink_led.bin and blink_led.elf.

NOTE: On Linux, if the build fails and arm-none-eabi-gcc is not found, edit the makefile by adding the full path to arm-none-eabi-gcc and to arm-none-eabi-objcopy. These tools are both found in the bin folder where GNU Tools for ARM Embedded Processors was installed.

On Windows, the console output from the build command should be as shown in Figure 20.

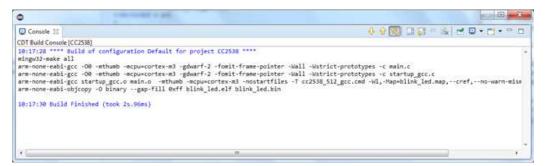

Figure 20. Build Command

5.8 Load the Image to Target (Windows)

For Windows, the binary image that was generated in the previous section will be loaded to target using the TI Flash Programming tool.

Load the binary image to target by running the Flash Programmer tool: Run \rightarrow External Tools \rightarrow 1 Flash program. The console output should be similar to the output shown in Figure 21.

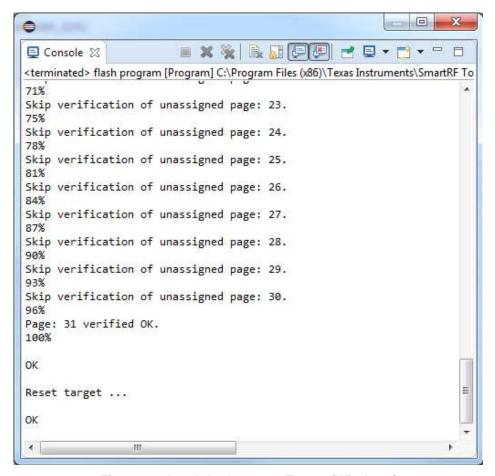

Figure 21. Load the Image to Target (Windows)

5.9 Load the Image to Target (Linux)

For Linux, the *.elf file that was generated in the previous section will be loaded to target using the Uniflash Flash programming.

Load the binary image to target by running the Flash Programmer tool: Run \rightarrow External Tools \rightarrow 1 Flash program. The console output should be similar to the output shown in Figure 22.

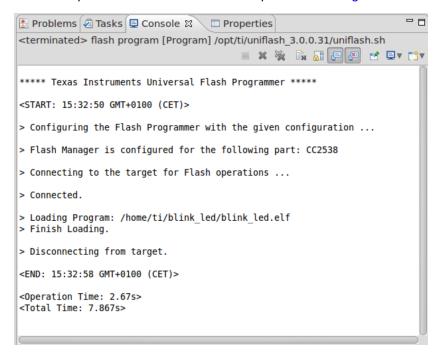

Figure 22. Load the Image to Target (Linux)

5.10 Running the Software Example From Debugger

After the image is downloaded to target, the debugger can be launched.

- Select Run → Debug Configurations, and the Debug Configurations panel will be opened (see Figure 23).
- 2. Make sure that the GDB server agent is started (as described in Section 5.5 for Windows and Section 5.6 for Linux)
- 3. Select the 'blink_led' configuration under 'GDB Hardware Debugging' and press the 'Debug' button.
- 4. The debugger connects to target through the GDB server. The debugger prompts you to 'Confirm Perspective Switch'. Click 'Yes' to switch to the Debug perspective. The execution of the application can now be controlled from the debugger in Eclipse (press F8 (or the Resume button) to start running the application).

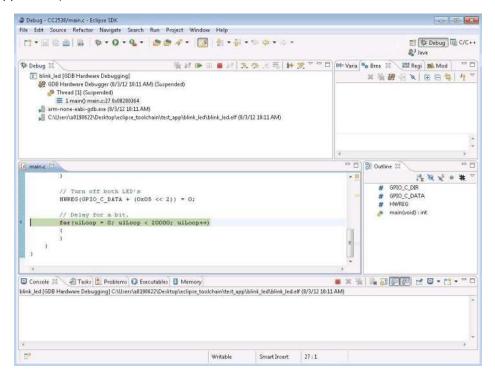

Figure 23. Running the Software Example From Debugger

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
